EXPERIMENT 7

Integrating Zoho Creator with Another Zoho Service Using Connections and APIs

Student Admission Request & Processing Management | Zoho Creator

Objective

Planasecureintegration between the Student Admission application and a relevant Zoho service or external API.

Platform / Application

Platform: Zoho Creator. Application: Student Admission Command Center / Student Admission Request & Processing Management. Primary form: Admission_Request_Form. The LC-09 specification and supplied application export were used as the project context.

Theory

Connections store authorized access for supported services. APIs allow applications to exchange data, but integrations require correct scopes, field mapping, error handling and data minimization.

Procedure

1.Choose one integration use case, such as sending an acknowledgement through an authorized Zoho service or creating a task for a claims officer.

2. Identify the data required: claim reference, claim type, status and recipient address only when necessary.

3. Create an authorized connection with the minimum required scopes, following the current Zoho interface.

4. Map source fields to destination fields and configure a controlled test request.

5. Test successful response, expired authorization, invalid input, rate limit and service outage; document how errors are handled.

Design / Observation Table

Integration element	Insurance example
Source	Claim_Request_Form
Trigger	New claim or status change
Payload	Claim reference, claim type, current status
Destination	Authorized Zoho service / API
Safeguard	Least privilege, minimal personal data, error logging

Result / Conclusion

Aconnection-based integration can reduce manual re-entry. This report is a design and implementation guide; a working integration requires credentials, permissions and testing in the user's account.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is already enabled.
