EXPERIMENT 11

Deploying the Application from Development to Production

Student Admission Request & Processing Management | Zoho Creator

Objective

Prepare a controlled release process for the Student Admission Command Center.

Platform / Application

Platform: Zoho Creator. Application: Student Admission Command Center / Student Admission Request & Processing Management. Primary form: Admission_Request_Form. The LC-09 specification and supplied application export were used as the project context.

Theory

Deployment moves an application from a development or test environment into use by real users. A release should include validation, permissions, test data cleanup, backup/export planning, user guidance and rollback considerations.

Procedure

1. Keep a development copy for changes and use synthetic data during testing.
2. Verify form fields, required rules, reports, workflows, calculations and role permissions.
3. Test a complete claim submission through the report and any configured notification.
4. Review public sharing, portal access, data retention and personal-data exposure before launch.
5. Publish or deploy using the options available in the account, communicate the release and monitor errors after launch.

Design / Observation Table

Stage	Checklist
Development	Build forms, reports and workflows
Testing	Validate field rules, permissions and edge cases
Pre-release	Remove test data; verify recipients and access
Production	Publish to intended users and provide instructions
Post-release	Monitor failures and maintain a rollback/export plan

Result / Conclusion

Astagedrelease reducesthe risk of exposing incorrect configuration or personal information. Exact deployment options depend on the Creator account and application type.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is already enabled.
