EXPERIMENT 12

Implementing Security Features and Governance Practices

Student Admission Request & Processing Management | Zoho Creator

Objective

Establish practical security and governance controls for sensitive insurance-claim data.

Platform / Application

Platform: Zoho Creator. Application: Student Admission Command Center / Student Admission Request & Processing Management. Primary form: Admission_Request_Form. The LC-09 specification and supplied application export were used as the project context.

Theory

Governance covers ownership, access, data handling, change approval and auditability. Security controls should follow least privilege, protect credentials, minimize collected data and keep a record of important changes.

Procedure

1. Classify claim fields by sensitivity, including address, phone, email, signature and uploaded evidence.
2. Review sharing links, user roles, report permissions and access to uploaded files.
3. Limit personal data in notifications and external integrations to what is required.
4. Define who can change form structure, workflows and settlement fields; test changes before release.
5. Document retention, backup/export, incident reporting and periodic access-review procedures.

Design / Observation Table

Control	Insurance application practice
Least privilege	Separate claimant, investigator, officer and admin access
Data minimization	Do not expose full evidence or personal details in broad reports
Change management	Test and approve workflow/form changes
Auditability	Retain available logs and document key status changes
Credential safety	Use authorized connections; never place secrets in scripts or reports

Result / Conclusion

Securityisan ongoingconfiguration and governance activity. Validate the actual app's permissions and local organizational requirements before production use.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is already enabled.
