EXPERIMENT 14

Pro-Code Extension Using Zoho Catalyst or Custom Functions

Student Admission Request & Processing Management | Zoho Creator

Objective

Explorehow custom functions or a supported external service could extend the insurance-claim application beyond its standard configuration.

Platform / Application

Platform: Zoho Creator. Application: Student Admission Command Center / Student Admission Request & Processing Management. Primary form: Applicant_Request_Form. The LC-09 specification and supplied application export were used as the project context.

Theory

Pro-code extensions are useful when logic, integration or processing requirements exceed visual configuration. Deluge custom functions and external services such as Zoho Catalyst may be options, depending on account access and the use case.

Procedure

1.Choose aspecific extension, such as validating a claim reference with an external system or generating a structured notification payload.

2. Define input fields, expected output, error cases and authorization requirements before coding.

3. Implement with the supported function or service available in the environment; keep secrets in approved connection mechanisms.

4. Test valid data, missing fields, timeouts, duplicate requests and permission failures.

5. Document how the extension is called, monitored, versioned and disabled if it fails.

Design / Observation Table

Extension example	Purpose
Custom Deluge function	Apply reusable claim validation or routing logic
External API	Check policy details where an authorized API exists
Catalyst service	Host a supported custom backend when justified
Error handling	Return clear errors and prevent silent data loss

Result / Conclusion

Pro-codeextensions canadd flexibility while retaining the low-code interface. The precise implementation depends on available services, APIs, credentials and the account's permissions.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is already enabled.
